Task 2.7

Search for users

For users should be possible to search for:
- recipes
- ingredients
- other users (to check for example which recipes they created)
    - it will be implemented later

Ideas to implement this search method:
- 1. The search function should have a select tag, so the user can specify what they are looking for.
- 2. The users are searching for the whole name or a part of the name, and the filter method should sort the objects according to models.
    - First: Recipe
    - Second: Ingredient
    - Third: User (will be implemented later)
